

# **S95 Series Step Controls**

www.indeeco.com

# Operation

The S95 Series step controls can be used to replace earlier models of M72 Series, S71 Series, S81 Series and S92 Series step controls. Contact the factory for additional information and crossreferencing. Common applications are HVAC duct heaters, process air heaters and boilers.

Features include status leds and diagnostics. A test mode will cycle the selected stages, testing the load wiring, contactors and stage operation.

A vernier control is available, which results in more precise control than is possible with a standard step control. A separate slave power controller provides proportional control (0-100% load), in between the switching of step control stages.

Two different control modes and switching schemes can be selected, per the following:

#### Specifications

- •UL Recognized: File E52105 Guide XAPX2
- Storage Temp: 0° to 186°F
- •Operating Temp: 0°F to 167°F
- .Line Voltage: 120/240VAC +/-10%, 12VA max
- •Frequency: 47 to 63 Hertz
- •Input Impedance:  $250\Omega$  (mA),  $33K\Omega$  (VDC)
- Input Wire Range: 18-22 AWG, copper only

**Dead Band Control:** Typically used by older model step controls. When the input signal is within the input range, the stages do not change. Above the input range, stages are added. Below the input range, stages are removed.

**Proportional Control:** The total number of stages ON, including the optional vernier stage, is linear with respect to the input range. For example, a 5.0VDC signal to a 0-10VDC input will result in half of the stages being ON. The vernier control operates 0-100% between stages.

**Progressive Switching:** Even wear on stages is achieved by turning ON stages sequentially in random order. When removing stages, the first stage ON is the first stage OFF.

**Linear Switching:** Stage 1 is the first stage to be turned ON and the last stage turned OFF.

For example: 1,2,3,4,5 ON then 5,4,3,2,1 OFF.

- Stage Outputs: Pilot-duty triacs
- Stage Ratings: 120/240VAC, 90VA max
- Stage Terminal Block: 12-22 AWG, copper only
- •Selectable Time Delay: 5 seconds 10 minutes
- •Vernier Output: 12VDC pulse, 0.5 VA max.
- Slaves Allowed: 1 per 10 stage master
- Slave Cable: 30" ribbon-cable, supplied with unit

Catalog and Part Numbers: 201 & 204 Series

Six snap-in nylon standoffs. Typically used in INDEECO electric duct heaters and	M = master S = slave	2 = terminal blocks 1 = QC (obsolete)	I = fixed for linear staging proportional control regardless of dip switch				
process air heaters.	05 = 5 stages* 10 = 10 stages	Input Code S = (see note)	setting.				

Note: Masters have selectable inputs: A (2200 ohm), C (135 ohm), E (4-20mA), L (0-10VDC) Slaves do not have an input nor control code.

\* The 05=5 stage unit is no longer available.

# Catalog and Part Numbers: 205 Series

2 0 5 - S 9 5	- M 1 0	- 2A	- 21
Mounting & Series	Туре	Terminals	Temperature Range
NEMA 1 enclosure with setpoint adjuster in lid.	M = master	2 = terminal blocks	$21 = 0.100^{\circ} F$ $41 = 50.150^{\circ} F$ $43 = 50.180^{\circ} F$
Requires 310 Series thermistor sensor. Order separately.	05 = 5 stages* 10 = 10 stages	<b>Input Code</b> A = 2200 ohms	43 = 30-180 °F 47 = 100-210° F 51 = 120-250° F 55 = 150-250° F

\* The 05=5 stage unit is no longer available.

### Setup and Diagnostics

- O POWER (RED)
- ERROR (YELLOW)
- SMI (GREEN)

CONTROL JP1 TEST MODE 😇 MODE

<u>WARNING:</u> Remove 120/240 VAC power to the step control and stages before changing any settings. Changes take effect when power is restored.

- 1) Turn on 1 of 4 inputs. Set remaining inputs to OFF.
- 2) Select DEADBAND or PROPORTIONAL control.
- 3) Select PROGRESSIVE or LINEAR switching.
- Select the VERNIER control mode if the optional power controller is used, otherwise set to OFF.
- 5) Select the time delay between stages (see table).
- 6) Select the number of stages by adding up the total. For example, 10 stages would be -2- and -8-.
- Potentiometer RA3 is used for 2200 ohm inputs only. The span can be adjusted from ± 200 ohm (fully clockwise) to ± 20 ohms (fully counter-clockwise).

Delay in	S	Delay in		
Seconds	Delay 1	Delay 2	Delay 3	Minutes
5	No	No	No	1
10	Yes	No	No	2
15	No	Yes	No	3
20	Yes	Yes	No	4
30	No	No	Yes	5
40	Yes	No	Yes	7
50	No	Yes	Yes	9
60	Yes	Yes	Yes	(1 sec)

The POWER led is ON when 120/240VAC power is applied to the control. The ERROR led is ON when the input or stage switches are set incorrectly or jumper JP1 is set for test mode (see **Operation**). When JP1 is set to control mode, the step control functions normally. The SMI led is OFF when the input signal is below the input range and ON when above the input range. It flashes when the input signal is within the selected input range. Individual STAGE leds (not shown) are ON when the triac output is energized.

Units with the V input code have an adjustable 2VDC minimum 10VDC max input range. Attach a DC voltmeter to TP1 (-) and TP3 (+). Adjust RA1 to the upper VDC range. Move the meter from TP3 (+) to TP2 (+). Adjust RA2 to the lower VDC range. The HIGH input range must be at least 2.0VDC greater than the LOW input range.

#### Wiring Diagram: Outputs

Optional Single or Three Phase Slave Power Controller

Wiring Diagrams: Inputs

Use + VDC for adjustable VDC input & Use + mA DC terminal for adjustable mA input.
